NOTE ON THE UNICYCLIC GRAPHS WITH THE FIRST THREE
LARGEST WIENER INDICES

E. GLOGIĆ AND LJ. PAVLOVIĆ

ABSTRACT. Let $G = (V,E)$ be a simple connected graph with vertex set $V$ and
degree set $E$. Wiener index $W(G)$ of a graph $G$ is the sum of distances between
all pairs of vertices in $G$, i.e., $W(G) = \sum_{\{u,v\} \subseteq G} d_G(u,v)$, where $d_G(u,v)$ is the
distance between vertices $u$ and $v$. In this note we give more precisely the unicyclic
graphs with the first three largest Wiener indices, that is, we found another class of
graphs with the second largest Wiener index.

1. INTRODUCTION

Let us denote by $V(G)$ and $E(G)$ the set of vertices and edges, respectively, of a
simple connected graph $G$. The order of $G$ we will denote by $n(G)$ and it is $n$. We
deal with unicyclic graphs, that is, the number of the edges is also $n$. If $e$ is an edge
of $G$, $G - \{e\}$ represents graph obtained from $G$ by deleting edge $e$. The distance
distance $d_G(u,v)$ between vertices $u$ and $v$ in $G$ is the number of edges on a shortest path
connecting these vertices. The distance of a vertex $v \in V(G)$, denoted by $d_G(v)$, is
the sum of distances between $v$ and all other vertices of $G$, $d_G(v) = \sum_{x \in V(G)} d_G(v,x)$.
The Wiener index $W(G)$ of $G$ is defined as

$$W(G) = \sum_{\{u,v\} \subseteq G} d_G(u,v) = \frac{1}{2} \sum_{v \in V(G)} d_G(v).$$

This topological index was introduced by Wiener 1947 in [11]. This index found
application in chemistry [3, 6]. At the beginning, it was conceived only for trees.

Key words and phrases. Unicyclic graphs, Wiener index, distance, extremal graphs

Wiener showed that for tree $T$ on $n$ vertices

$$W(T) = \sum_{e} n_1(e)n_2(e),$$

where summation goes over all edges of tree, $n_1(e)$ and $n_2(e)$ are the number of vertices which lie in the components of $T - \{e\}$. The definition of the Wiener index in terms of distances between vertices of a graph, such as equation (1.1) was first given by Hosoya [4]. This index attracted attention chemists and mathematicians. We will mentioned some important results. Between the trees the smallest Wiener index has the star $S_n$ and the largest has the path $P_n$, while among connected graphs the smallest Wiener index has the complete graph $K_n$ and the largest the path $P_n$ [1, 2]. Operations on graphs which augment or reduce the Wiener index was studied in [5, 7–9]. The recent results on the distance based topological indices one can find in [12].

In this paper we improve theorem given in [10] about the unicyclic graphs with the first three largest Wiener indices, i.e., we found new class of graph with the second largest Wiener index.

2. Improvement

We use terminology from [10]. Let $G = (V, E)$ be an unicyclic graph with its unique circuit $C_m = v_1v_2 \ldots v_rv_1$ of length $m$, $T_1, T_2, \ldots, T_k$, $0 \leq k \leq m$, are all nontrivial components (they are all nontrivial trees) of $G - E(C_m)$, $u_i$ is the common vertex of $T_i$ and $C_m$, $i = 1, 2, \ldots, k$. Such graph is denoted by $C_m^{u_1, u_2, \ldots, u_k}(T_1, T_2, \ldots, T_k)$. Specially, $G = C_n$ for $k = 0$. And if $k = 1$, we write $C_m(T_1)$ instead of $C_m^{u_1}(T_1)$. Let $n(T_i) = l_i + 1, i = 1, 2, \ldots, k$, then $l = l_1 + l_2 + \cdots + l_k = n - m$. $P_n$ is a path of order $n$.

**Theorem 2.1.** [10] Let $G = C_m^{u_1, u_2, \ldots, u_k}(T_1, T_2, \ldots, T_k)$ be an $(n, n)$-graph of order $n \geq 6$. If $G \not\cong C_3^i(P_{n-2}), C_4^i(P_{n-3})$, then

$$W(G) \leq W(C_3^{i1}(T(n - 5, 1, 1))) < W(C_4^i(P_{n-3})) < W(C_3^{i2}(P_{n-2})),
$$

with the equality if and only if $G \cong C_3^{u_1}(T(n - 5, 1, 1))$, where $C_3^{u_1}(T(n - 5, 1, 1))$ is showed in Figure 1.

![Figure 1. Graph $C_3^{u_1}(T(n - 5, 1, 1))$](image)

We discovered another class of graph $C_3^{u_1, u_2}(P_2, P_{n-3})$ with the second largest Wiener index. Graph from this class is showed in Figure 2.
Our improved theorem is the following theorem.

**Theorem 2.2.** Let \( G = C_m^{u_1,u_2,\ldots,u_k}(T_1,T_2,\ldots,T_k) \) be an \((n,n)\)-graph of order \( n \geq 6 \). If \( G \not\cong C_3(P_{n-2}), C_4(P_{n-3}), C_3^{u_1,u_2}(P_2,P_{n-3}) \), then

\[
W(G) \leq W(C_3^{u_1,u_2}(T(n-5,1,1))) < W(C_3^{u_1,u_2}(P_2,P_{n-3})) = W(C_4(P_{n-3})) < W(C_3(P_{n-2})),
\]

with the equality if and only if \( G \cong C_3^{u_1}(T(n-5,1,1)) \), and for \( n = 7 \) equality holds for \( G \cong C_3^{u_1,u_2}(P_3,P_3) \).

In order to prove this theorem we use next theorem from [10].

**Theorem 2.3.** [10] Let \( G = C_m^{u_1,u_2,\ldots,u_k}(T_1,T_2,\ldots,T_k) \) be an \((n,n)\)-graph. Then

\[
W(G) = W(C_m) + \omega + (m-1)\sum_{i=1}^{k} \omega_i + \sum_{i=1}^{k} W(T_i)
+ \sum_{i=1}^{k} \sum_{j=i+1}^{k} (l_i\omega_j + l_i l_j d_{C_m}(u_i,u_j) + l_j\omega_i),
\]

where \( l_i = n(T_i) - 1, \omega_i = d_{T_i}(u_i), i = 1,2,\ldots,k, \omega = d_{C_m}(u), u \in V(C_m) \).

**Proof of Theorem 2.1.** Using Theorem 2.3, we calculate the Wiener index of \( C_3^{u_1,u_2}(P_{l_1+1},P_{l_2+1}) \), i.e.,

\[
W(C_3^{u_1,u_2}(P_{l_1+1},P_{l_2+1})) = W(C_3) + \omega + (n-3)d_{C_3}(u) + 2(d_{P_{l_1+1}}(u_1) + d_{P_{l_2+1}}(u_2))
+ W(P_{l_1+1}) + W(P_{l_2+1}) + l_1 d_{P_{l_2+1}}(u_2) + l_1 l_2 d_{C_3}(u_1,u_2)
+ l_2 d_{P_{l_1+1}}(u_1)
= 3 + 2(n-3) + 2 \left( \binom{l_1 + 1}{2} + \binom{l_2 + 1}{2} \right) + \binom{l_1 + 2}{3}
+ \frac{l_2 + 2}{3} + l_1 \binom{l_2 + 1}{2} + l_1 l_2 + l_2 \binom{l_1 + 1}{2}
= \frac{1}{6} \left( 12n - 18 + l_1^3 + 9l_1^2 + 8l_1 + l_2^3 + 9l_2^2 + 8l_2
+ 3l_1 l_2 (l_1 + l_2 + 4) \right).
\]
Since $l_1 + l_2 = n - 3$, we get

$$W(C_3^{u_1,u_2}(P_{l_1+1}, P_{l_2+1})) = \frac{1}{6} \left(n^3 - 7n + 12 - 6l_1l_2\right).$$

Since $W(C_3^{u_1}(T(n-5, 1, 1))) = \frac{1}{6}(n^3 - 13n + 30)$, we have

$$W(C_3^{u_1,u_2}(P_{l_1+1}, P_{l_2+1})) - W(C_3^{u_1}(T(n-5, 1, 1))) = n - 3 - l_1l_2.$$

If $l_1 = 1$ and $l_2 = n - 4$, we have $n - 3 - l_1l_2 = 1 > 0$, which means that the graphs $C_3^{u_1,u_2}(P_2, P_{n-3})$ have greater Wiener-index than $C_3^{u_1}(T(n-5, 1, 1))$ and $W(C_3^{u_1,u_2}(P_2, P_{n-3})) = n^3 - 13n + 36 = W(C_4(P_{n-3}))$. If $l_1 = 2$ and $l_2 = n - 5$, we have $n - 3 - l_1l_2 = 7 - n$, which is equal to 0 for $n = 7$.

The Theorem 2.1 is symmetrical with Theorem 7 from [10] which characterize the graphs with three smallest Wiener indices.
