Abstract: Approaches to understanding the essence of the notion of 'sustainable forest management' are systematized. The peculiarities of the Russian experience of forest relations institutionalization on the principles of sustainable development are identified. As the state policy of the Russian Federation in the sphere of forest utilization, protection, preservation and reproduction is targeted at forests retaining and growth, as well as meeting the needs of the population in quality forest products and useful forest properties, the paper reveals the main tendencies of forestry development in the Russian Federation in the period of 2007-2014. In those years, the activity on protection, preservation and reproduction of forests on the state territory of Russia showed the decline in the volume of activities and events. There was a marked tendency towards forest resources loss because of wild-fires. Methodological bases for state forest management monitoring with the view of forming 'green economy' in the context of sustainable development and eradication of poverty are defined. The methodology for sustainable forest development monitoring with the strategic goal of sustainable forest management, i.e. support and accrual of forest social and economic functions, is worked out having in mind the indicators of social and economic tasks solving for forestry development and the analysis of the dynamics of perception of social and economic consequences of forest enterprises activity by the representatives of the bodies of local self-administration and social organizations.

Key words: sustainable forest management, 'green economy', forest social-economic functions, state forest management in the Russian Federation

INTRODUCTION

Social and economic development of the society in XX century, focused on fast rates of economic growth, was for a long time carried out without taking into account the exhaustibility of many kinds of natural resources. As a result, the humanity has faced contradictions between the growing needs of the society and the impossibility of the biosphere to meet these needs.

The international agreements of the end of XX and the beginnings of XXI centuries, in which the Russian Federation participated actively, proclaimed the necessity of transition of the world community to sustainable development. The purpose of the state strategy of sustainable development of Russia is maintenance of the balanced solution of social and economic tasks and the problems of preservation of natural resources potential for the sake of both present and future generations.

The idea of interfacing economic, ecological and social aspects of development of the society and forest ecosystems has been realized in the concept of sustainable forest management.

Utilization and reproduction of forests as evolutionary process is determined by branch peculiarities, the main of which is a long period of forest cultivation. Modern results of this process are determined by the organization of forestry, the system of forest management in the past, and the present activities predict the results for future. Therefore, monitoring of real tendencies of utilization and reproduction of forest resources and their objective analysis form the base for information support of all levels and functions of management in developing the state policy and strategy in the field of utilization, protection, preservation and reproduction of forests, social and economic development of forest sector of economic activity of the state and its regions.

The goal of the research consists in systematizing methodological ideas and developing a technique for sustainable forest management monitoring with a view of sustainable forest management, i.e. support and accrual of forest social and economic functions.

The tasks directed on the achievement of the goal of the research:

- to systematize theoretical and methodological approaches to understanding of essence of the notion 'sustainable forest management';
- to reveal the features of the Russian forest relations institutionalization on the principles of sustainable development;
- to define methodological bases for state forest management monitoring with the view of forming 'green economy' in the context of sustainable development and eradication of poverty;
- to suggest the technique for sustainable forest development monitoring with the strategic aim of sustainable forest management, i.e. support and accrual of forest social and economic functions.

The problems of sustainable development are in the focus of all international summits, forums, symposiums during which the basic processes and tendencies in the field of economy, social development and environment are analyzed, as well as principles, directions of transition of the world community to sustainable development are worked out [09]. The concept of sustainable development was proclaimed in 1992 in Rio de Janeiro by the heads of the states and the governments at the United Nations Conference on Environment and Development. Sustainable development is determined as the one that satisfies current needs, but does not threaten the ability of future generations to satisfy theirs. Sustainable long-term development does not represent a constant state of harmony, rather a process of changes in which the scale of resources exploitation, the direction of capital investments, orientation of technical development and institutional changes are correspond to present and future requirements [08]. At the conference, the basic requirement to organizing forestry relations was put forward, i.e. sustainable forest management.

In the Russian scientific environment there is a set of approaches to disclosing the essence of the notion 'sustainable forest management'.

With reference to forest administering, the strat-

egy of sustainable development is considered the strategy of sustainable forest management (sustainable development of forestry). Moiseyev N.A. points out that the term 'Sustainable Forest Management' means 'maintenance', i.e. preservation of an object of management at the level of its functionality, not supposing deterioration [07].

Professor Petrov A.P. considers that the meaning of the notion 'sustainability' with reference to forestry should be considered in three aspects: ecological, economic and political [11]:

- ecological aspect assumes preservation of the environment and rational use of natural resources,
- economic one is predetermined by limited natural resources, their economic availability,
- political aspect assumes creation and development of the political system providing formation of a legal society, achievement of social stability, as well as legislative consolidation of the property rights over all natural resources and their protection by the constitution.

Pisarenko A.I., Strakhov V.V. have formulated the transition of Russia to the model of sustainable development of the economy without damage to natural ecosystems as the transition from sustainable forest utilization to sustainable forest management, i.e. formation of 'a new theory of forestry' should rely upon ecological and social role of forests [12].

In the FAO research State of the World's Forests 2014 the importance of a social role of forests and the necessity of monitoring of social and economic benefits are marked. Social and economic benefits from forests mainly consist in consumption of forest goods and services. The research underlines the necessity of further strengthening the ties between social and economic benefits and development of more ecologically focused sustainable economy [13].

During the Helsinki and Montreal processes, countries-participants have developed principles, criteria and indicators used in estimation of sustainability of forest management. The criteria for these are a profile of practical activities in the sphere of forest management that provides the achievement of a goal in view.

The indicators are quantitative and qualitative characteristics, estimations, descriptions, allowing to evaluate, analyze and predict the actions against the corresponding criterion. Russia participated in those international negotiating processes. The results of the discussion on the criteria and indicators of sustainable forest management laid the basis of the document 'Criteria and indicators of sustainable forest management in the Russian Federation' developed in accordance with international experience in sustainability forest management monitoring (Table 1).

The requirement to organize forest management on the principles of sustainable development is a law in Russia. The Forest legislation and other forestry regulations of the Russian Federation are based on the following main principles (Figure 1).

Yet, the development of forestry on the principles of sustainable management has not led to expected effectiveness of forests utilization, to the reduction in the level of their damage and destruction, as well as the improvement of quality of forest resources reproduction. The activity in the sphere of forest protection, preservation and reproduction within the territory of the country in 2007-2014 is characterized by the decrease in the amount of works and activities. The steady tendency towards forest resources loss growth due to various adverse factors, including forest fires, was outlined (Table 2).

Table 1: Criteria for sustainable forest management

European list of criteria for sustainable forest management [2]
Criterion 1. Maintenance and appropriate accrual of forest resources and their contribution to global carbon cycle
Criterion 2. Maintenance of forest ecosystems viability
Criterion 3. Maintenance and preservation of forest productive functions (wood and not wood products)
Criterion 4. Maintenance, preservation and accrual of a biodiversity in forest ecosystems
Criterion 5. Maintenance and appropriate accrual of protective functions in forest management
Criterion 6. Maintenance of other social and economic functions and conditions
Criteria for conservation and sustainable management of temperate and boreal forests [3]
Criterion 1. Conservation of biodiversity
Criterion 2. Maintenance of forest ecosystems productivity
Criterion 3. Maintenance of sanitary wellbeing and viability of forest ecosystems
Criterion 4. Conservation and maintenance of soil and water resources
Criterion 5. Maintenance of the forest contribution to global carbon cycle
Criterion 6. Maintenance and accrual of long-term complex social and economic benefits aimed at meeting social needs
Criterion 7. Legal, economic and organizational frameworks for forest conservation and sustainable management
Criteria for sustainable forest management in the Russian Federation [4]
Criterion 1. Maintenance and conservation of forest productivity
Criterion 2. Maintenance of appropriate sanitary state and viability of forests
Criterion 3. Conservation and maintenance of protective forest functions
Criterion 4. Conservation and maintenance of forests biodiversity and their contribution to global carbon cycle
Criterion 5. Maintenance of social and economic functions of forests
Criterion 6. Tools of forestry policy for sustainable forest management support

MAIN PRINCIPLES OF FOREST LEGISLATION OF THE RUSSIAN FEDERATION	
1. Sustainable forest management, conservation of biodiversity of forests, raising of their potential capacity	
2. Conservation of environmental, water protecting, preservative, sanitary-hygienic, health-promoting and other beneficial forest functions with the aim of providing everyone with favorable environment	
3. Forests utilization with the view of their global environmental importance as well as duration of their growth and other natural features of forests	
4. Provision of multi-purpose rational non-stop inexhaustible forest utilization to meet the needs of the society in forests and forest resources	
5. Forest reproduction and reclamation, increasing its capacity	
6. Provision of forests protection and preservation	
7. Participation of citizens and non-governmental organizations in drafting decisions realization of which can affect forests utilization, protection, preservation and reproduction in the ways and forms established by the legislation of the Russian Federation	
8. Forests utilization in the ways which do not damage the environment and human health	
9. Breaking down the forest types into categories depending on their target purpose and establishing the categories of protective forests depending on their useful functions	
10. Inadmissibility of forest utilization by state and local administration bodies	
11. Paying fee for forest utilization	

Figure 1: The principles of forest legislation of the Russian Federation[5]

Table 2: Indicator dynamics of forest protection, maintenance and reproduction in the Russian Federation

Indicators	Years								Annual mean growth rate, per cent
	2007	2008	2009	2010	2011	2012	2013	2014	
Forest reproduction, thds ha	872.2	828.4	836.7	811.5	860.0	841.7	872.3	863.0	99.8
planting in-cluded	202.4	191.4	181.4	170.8	196.5	184.9	186.9	187.4	98.9
Forest stand lost, thds ha	319.3	273.5	446.6	801.6	418.6	378.7	619.8	no data	111.7
Number of wild-fires, thdsea	17.8	26.3	23.2	34.8	21.1	20.2	25.3	17.1	99.4
Forest fire area, thds ha	1036.0	2070.0	2112.0	2027.0	1408.0	2101.2	2733.4	3738.2	120.1

In 2014 state expenditures on forests protection, maintenance and reproduction amounted to more than 50 rubles per 1 ha of forest area, which exceeds almost twice the state returns on

their utilization (Figure 2).

A negative tendency in the dynamics of forest resources state and utilization development is characteristic for many countries.

Figure 2: State returns on forests utilization and state expenditures on their protection, maintenance and reproduction, Rb/ha

During the last two decades, some crises broken out in the world because of climate changes and biodiversity reduction and connected with power, foodstuff and water resources, as well as the global financial and economic crises. For more effective promotion towards sustainable development some international organizations have developed the concepts of 'green economy' and 'green growth', considering them the 'engines' on the way of transition to sustainable development [1]. The 'green economy' is based on the principles of state-private partnership and aspires to correct the existing market and institutional failures. 'Green growth' represents development in the 'green economy' environment.

RESEARCH METHODS

As far back as the middle of XX century, Russian academic economists in the field of forestry specified the necessity to account all the variety of forest aspects. In particular, Prof. T.S. Lobovikov (1909-1999) defined the scientific bases of forestry as follows, 'Biological and silvicultural principles and rules make a substantial part of the complex of scientific foundations of forestry. Its other part is social and economic laws ...' (6).

Developing in line with global tendencies of re-

alization of 'the green economic initiative' and development of 'green' economy in the context of sustainable development and liquidation of poverty, the Russian Federation has defined the strategy of 'green' growth, integrating economic, ecological and social interests, to be the state policy in the field of utilization, protection, preservation and reproduction of forests. Realization of state policy in the field of utilization, protection, preservation and reproduction of forests is directed at the achievement of the following goals [10]:

- a) in the sphere of economics they are efficient forest sector management and GDP increase
- b) in forest sector on the basis of market demand;
- c) in the sphere of ecology they are favorable environment for citizens and preservation of biospheric role of Russian forests;
- d) in social sphere they are growth of a standard of living of the citizens connected with forests and sustainable social and economic development of forest territories.

To realize the state policy in the field of utilization, protection and reproduction of forests the state program of the Russian Federation Devel-

opment of forestry for 2013-2020 was adopted. Performance evaluation for forestry development is based on the system of indicators.

The substantial analysis of the system of indicators shows, that they are predominantly directed on revealing of the degree of forests conservation and their contribution to state incomes, not reflecting the achievement of the established economic and social goals of the state forest policy.

The strategic approach to forest state management allows to generate the hierarchy of its functions: commitment to goal realization, change management, adaptation and self-organizing on the basis of effective utilization of multi-resource forest potential. From the viewpoint of system approach, 'purposefulness' is considered a system-forming element. Strategic management is geared at the general objective of the system. The management efficiency is finally determined by the degree of achievement of the goal in view.

The processes monitoring as the system of observing the conditions of objects, phenomena, processes with the aim of their estimation, control, and forecasting allows to estimate the results and correct the actions of the managing system. The monitoring procedure should be proved and reproduced in time to obtain comparable results and change estimation.

The strategic basis for the development of 'green' economy in the context of sustainable forest management is the effect of decoupling, i.e. dividing of the trends of social and economic growth and depauperization and degradation of forest resources, therefore the technique of monitoring of forest sustainable development should also reflect the dynamics of social and economic results of forestry development and provide research activities and data gathering necessary for definition of at least the following indicators (parameters) (Table 3) [08].

Table 3: Indicators of social and economic results of forestry development

<i>Social and economic goals in view</i>	<i>Indicators</i>	<i>mea units</i>
1. Increase of the contribution of forest sector into the GDP	Growth of production volumes of wood and wood products	%
	Growth of production volumes of non-wood forest products	%
	Growth of production volumes of products with high added value	%
2. Increase of the level of occupation among the population	Increase of workplaces	%
3. Increase of the level of income among the population	Average monthly salary increase	%
4. Preservation and development of scientific-technical and innovative capacity	Investments into R&D and innovation infrastructure per 1 ha of forest area	thdsRb/ha
	Expenditure growth for staff training	thdsRb/ha
5. Social infrastructure development	Investments into creation and modernization of the objects of social infrastructure per 1 ha of forest area	thdsRb/ha
6. Creation and improvement of transport infrastructure	Investments into forest roads building and maintenance per 1 ha of forest area	Rb/ha

Beside the analysis of objective quantitative indicators of social and economic problems solution in forestry management, the account of quantitative feedback from local community is necessary as well. We recommend to interview essential number of local government bodies represen-

tatives, social agencies and local population to reveal the dynamics of perception of social and economic consequences of operating performance of forest enterprises in specific territories, as well as the prospects of their development. Interviewing should reveal the opinion of public

representatives on the following:

1. What is the level of corporate social responsibility of forest enterprises? Do they function as an open system, i.e. interrelated with the environment?
2. Do forest enterprises contribute to the increase of people wellbeing? What is this shown through?
3. Does the performance of forest enterprises influence quality of the environment people live in? What are the benefits and the drawbacks of such influence?
4. Do forest enterprises come into conflict with the population, local government bodies?

The results of monitoring objective and subjective indicators of social and economic problems solution in forestry development should be used in both forestry development programs elaboration and implementation and their updating.

DISCUSSION

The aim of the research consists in generalization and systematization of methodological provisions and development of a technique for monitoring sustainable forest management with the strategic purpose of sustainable forest management, i.e. maintenance and augmentation of social and economic functions of forests.

Social and economic development of a society is provided through solving such problems as increase of level of employment of the population, growth of the level of income of the population, preservation and improvement of quality of the environment, preservation and development of scientific, technical and innovative capacity, development of social infrastructure, creation and improvement of transport infrastructure. Forests represent a base element of 'green economy' and they frequently determine the quality of life of the population and the level of development of the economy within a specific territory. Despite the huge standing volume in the Russian Federation (83.1 billion m³; the second largest in the world, constituting 15.8 % of world reserves), the contribution of a timber complex into GDP is low, approximately amounting to 3 %. In that context, in remote from the centers of urbanization areas rich in forests development of logging and timber processing enterprises is insignificant for employment of the population and attraction of investments into the economy of municipali-

ties. The forest enterprises should develop as an open system interrelated and tightly bound to the environment, striving to get maximum profit from the entrepreneurial business based on utilization of forest resources; they should not reduce volume and quality of forest ecosystem services and negatively influence the level and quality of life of local population.

Defining the indicators of social and economic development of forestry, it is necessary to bear in mind the strategic goal of sustainable forest management which is purposeful, long-term, economic interrelation of the person and forest ecosystems. Monitoring of such indicators is an important tool for revealing and defining the problems on the way of sustainable development and estimation of effectiveness of measures at all levels of state government.

CONCLUSIONS

The state policy of the Russian Federation in the field of forest utilization, protection, maintenance and reproduction develops in line with global tendencies. Russia has intentionally chosen the strategy of 'green growth' as forest policy. Thus, qualitative analysis of the parameters of realization of the state program for forestry development has revealed, that they do not provide an opportunity for monitoring and estimation of social and economic aspects of sustainable forest management.

According to the forestry legislation, the sustainable forest management monitoring system in the Russian Federation includes carrying out state inventory of forests, state monitoring of forest reproduction as a part of ecological monitoring.

The suggested technique for monitoring of objective indicators (parameters) of social and economic results of forestry development and subjective perception of social and economic consequences of forest enterprises activity by public representatives alongside with qualitative and quantitative indicators of forest resources conditions and their contribution to preservation of favorable environment will allow to provide the balance of interests of the state, business and the population within the framework of sustainable forest management.
