(Received 30 October 2017; accepted 09 November 2018)

Abstract

The aim of this study is to explore relationships among five factors: customer relationship management, customer satisfaction, customer loyalty, customer profitability, and customer retention. The sample of the study consists of 750 managers and employees of different restaurant in Riyadh, the capital city of Saudi Arabia. The questionnaire developed for the purpose of this study is distributed by hand to respondents. Out of 750 questionnaires distributed, 497 are returned with a high rate of response. The Analysis of Moment Structures (AMOS, Version 22) is used to analyze the collected data. The findings of the study revealed a significant influence of customer relationship management on customer satisfaction, a significant influence of customer satisfaction on both customer loyalty and customer profitability. Therefore, the data doesn't support the hypothesis that customer loyalty mediates the relationship between customer satisfaction and customer profitability. On the other hand, there are significant relationships between customer satisfaction and customer profitability and between customer profitability and customer retention, while there is no significant relationship between customer satisfaction and customer retention.

Keywords: customer relationship management, customer satisfaction, customer loyalty, customer profitability, customer retention.

1. INTRODUCTION

Organization are striving to retain customers in order to be able to cope with

many challenges. Examples of these challenges include the increased levels of competition among organizations, the advancements in information technology, the

* Corresponding author: badermeed@gmail.com

emergence of total quality initiative, the evolution of network economy (Minna & Aino, 2005), the need for product customization (Ashraf et al., 2015), and globalization (Kangu et al., 2017). One of the most important variables reported by authors which can be utilized as a solution to deal with these challenges is customer relationship management (CRM).

In fact, numerous authors cited different advantages of using CRM. Examples of these advantages include the enhancement of customer loyalty, profitability and satisfaction as well as organizational performance (ElKordy, 2014). Navimipour and Soltani (2016) indicate that the main aim of CRM systems is to increase the effective implementation of CRM processes, which in turn affects the effectiveness of their communications with customers. Alipour and Mohammadi (2011) consider CRM as a major competitive strategy which organizations could use to enhance their interactions with customers. Soliman (2011) found that CRM is significantly, directly and positively related to marketing performance. In their study on CRM and performance in the banking sector, Wachira and Were (2016) come to a significant impact of CRM on banks' performance. Kangu et al. (2017) figure out a positive impact of CRM on customer loyalty.

CRM has been defined as a method used by organizations to manage business relationships with their customers. The management of these relationships include maintain prosperous long-term relationships with loyal and profitable customers (Navimipour & Soltani, 2016). According to Ashraf et al. (2015), the concept of CRM is implanted in the management of customers relationships on the basis of the effective and efficient flow of information, and the

achievement of increased value delivered to the customers in addition to the reduced costs of the organization. According to Stojkovic and Dubricic (2012), CRM philosophy refers to an iteration process of four activities, which are knowledge discovery, market planning, interaction with customers and customer's data analysis. ElKordy (2014) adds that this process comprises the integration of sub-process, technology and customer orientation, which aims at enhancing the organization capability to effectively manage its profitable interactions with customers. Piroozfar and Yaghini (2012) conceptualize CRM based on two views; the strategic view and the technological view. According to them, the strategic view of CRM elucidates the evolution of CRM concept in terms of transactional and relational marketing in view of the fact that CRM is a final result of these two types of marketing, and the technological view of CRM, in which organizations adopt new practices such as data mining, data warehousing and best practices of customer interactions in order to deal with changes in business environment as the increased competition and the need for products customization. Kangal (2012) cited a number of CRM definitions in which the concept is considered as an approach steered towards customers, either through the emphasis on their lifecycles, as a relational strategy, a market competition method, or as a customer-driven technology.

To the best of the author knowledge, little studies are conducted to investigate the indirect effect of CRM on customer retention through customer satisfaction, customer loyalty, and customer profitability using a sample of service organizations such as restaurants. The main contribution of this study can be recognized through finding the

relationships between customer relationship management and customer satisfaction, customer satisfaction and customer loyalty, customer satisfaction and customer profitability, customer profitability and customer retention, as well as customer satisfaction and customer retention. On one hand, customer relationship might results in customer satisfaction, but customer satisfaction only is not enough to ensure customer loyalty Noor (2012), profitability or retention.

Numerous organizations observe the migration of some of their satisfied customers to another competitor organizations. One important factor considered as critical antecedent to cope with this case is customer loyalty. Even if an organization gains its customers loyalty, some of them accord nothing in terms of profitability and it may become unable to retain those loyal customers. In a word, for an organization to achieve success, it should be able to take possession of its own loyal and profitable customers in order to be able to retain them. In fact, this scenario is emerged from numerous discussions conducted by the researcher with different managers and employees from different organizations. This conclusion is consistent with CRM theory which indicates that organizations are required to retain loyal as well as profitable customers (Kangu et al., 2017).

In accordance with the contribution of this study, it tries to explore the relationship between customer relationship management and customer satisfaction the relationship between customer satisfaction and customer profitability through customer loyalty and the relationship between customer satisfaction and customer retention through customer profitability. Consequently, the

study seeks to investigate the mediation roles played by customer loyalty and customer profitability.

2. LITERATURE REVIEW AND HYPOTHESES DEVELOPMENT

2.1. Customer relationship management definition

A deep review of the literature in relations to definitions of CRM results in many definitions as can be seen in Table 1. It was concluded that CRM represents a mean by which an organization be in a position enables it to create superior value for itself and for its customers through building lasting relationships with those loyal and profitable customers.

2.2. Customer relationship management dimensions

Different dimensions of CRM found in the literature. Khodakarami and Chan (2014) categorized customer relationship management systems into three types: collaborative systems, analytical systems, and operational systems. Collaborative systems are used to manage the communication process between the company and the customer, while analytical systems are used to analysis customer data. On the other hand, the operational systems are used to enhance the efficiency of CRM processes. Bahrami et al. (2012) argue that CRM uses customers data and can be facilitated by information technology applications. i.e., E-CRM. In terms of dimensions of CRM found in the literature, Chen and Popovich (2003) identified three indispensable dimensions of CRM, which

Table 1. Definitions of CRM

Author (s)	CRM definition
Chen and Popovich (2003)	A combination of three ingredients directed to efficient and effective building and maintaining of relationships with customers
Stojkovic and Dubricic (2012)	A cyclic process of knowledge discovery, market planning, interaction with customers and customer's data analysis.
Parvatiyar and Sheth (2001) cited in Piroozfar and Yaghini (2012)	A strategy used to create a value for the organization and the customer on the basis of organizational activities concern acquiring and retaining specific customers.
Khodakarami and Chan (2014)	An information system utilized by the company in order to collect, store, analyze customer data to gain an expansive view of customers.
ElKordy (2014)	The integration of CRM processes, technologies, and organization along with customer orientation which enables the organization to manage its long-term profitable interactions with its customers.
Ashraf et al. (2015)	An information technology system used to manage organizations' external relationships, i.e., relationships with customers, and internal relationships, i.e., relationship among the organizational functions, in order to provide the customers with the intended value.
Navimipour and Soltani (2016)	An approach used by organizations to manage business relationships with their loyal and profitable customers.

are technology, processes and people.

Kincaid (2003) cited in Piroozfar and Yaghini (2012) emphasizes the use of information, technology, processes and people to implement CRM. ElKordy (2014) adds two dimensions, which were the organization of CRM activities and customer orientation. Minna and Aino (2005) assign three inescapable components of CRM from the technological view: the collaborative systems, the analytical systems, and the operational systems. Boudiaf (2016) appends two dimensions, which are key customer focus and customer knowledge. Urbanskiene et al. (2008) pinpoint four dimensions of CRM, which were key customer focus, CRM organization, knowledge management, and technology-based CRM. Kangal (2012) particularizes six dimensions of CRM: customers, management, relations, employees, processes, and technology. Dumitrescu and Fuciu (2009) describe of CRM aspects: front (direct relationships with customers) and back office operations (daily functions of the organization such billing and processing), business relationships with other organizations, CRM-related data

analysis such as number of customers and profitability.

Hassan et al. (2015) identified three components CRM: customer, relationship, and management. Adalikwu (2012) study CRM in terms of customer acquisition (contact rate with customer, regular assessment of customer profitability, and customer persuasion), customer enhancement (increased sales either by customized offers, switching barriers, or decreased cost of service), and customer recovery (added value in 4Ps and customized services). Based on the above-mentioned literature, one can conclude that CRM comprise: technology, employees, processes, relationships, information, and customers.

2.3 Customer relationship management and customer satisfaction

Many studies have been confirmed that the implantation of CRM processes would results in greater level of customer satisfaction (Richards & Jones, 2009; Adalikwu, 2012; Stojkovic & Dubricic, 2012; ElKordy, 2014; Khedkar, 2015; Singh

& Singh, 2016). In their study on the effect of CRM on customer satisfaction in banking sector, Hassan et al. (2015) found a positive effect of CRM on customer satisfaction. Consequently, the following hypothesis is suggested:

H1: CRM has a significant influence on customer satisfaction.

2.4. Customer satisfaction and customer loyalty

Kangu et al. (2017) defined customer loyalty in terms of their willingness to repeat purchases, referred new customers and loyalty programs. Using a sample of managers who are responsible for relationships with customers of 147 hotels in Kenya, the researchers found a significant relationship between IT-based CRM applications and customer loyalty. The study concluded that the technology infrastructure as a main component of CRM engenders customer loyalty. In fact, the direct relationship between CRM and customer loyalty is not one of the hypotheses suggested by the current study. Instead of that, this study explores the relationship between customer satisfaction and customer loyalty.

In this vein, Arokiasamy (2005) investigated the impact of customer satisfaction on customer loyalty and intention to switch and points out a positive impact of customer satisfaction on customer loyalty, while there is no significant relationship between customer satisfaction and intention to switch. Hence, the study regards customer satisfaction as a major requirement for customer loyalty. The positive relationship between customer satisfaction and customer loyalty is cited in many works (Bontis et al., 2007; Mohsan et

al., 2011; Hafeez & Muhammad, 2012). Therefore, the following hypothesis is postulated:

H2: customer satisfaction has a significant influence on customer loyalty.

2.5. Customer loyalty and customer profitability

According to ElKordy (2014), CRM theory considers customer loyalty as one of the most significant keys that organizations could use to enhance their profitability, and this may be due to the fact that loyalty is concerned with creating superior value for customers (Anderson & Jacobsen, 2000). In relation to the importance of customer loyalty in winning customer profitability, Babatunde and Ajayi (2010) give emphasis to the influence of customer loyalty on customer profitability. Ibojo and Asabi (2015) cited many studies that assure the positive impact of customer satisfaction on customer loyalty, which in turn improves the profitability. Thompson (2005) justify organizations' efforts to gain customer loyalty by numerous factors: increased customer profitability, increased number of customers, and increased quality of products and services. In order to examine these studies in Saudi settings, the following hypothesis is supposed:

H3: customer loyalty has a significant impact on customer profitability.

2.6. Customer satisfaction and customer profitability

Studies conducted to explore the impact of customer satisfaction on profitability make clear that both variables are positively associated. Coldwell (2001) illustrate that satisfied customers are more profitable than

non-satisfied customers. Ibojo et al. (2013) found a significant relationship between customer satisfaction and profitability.

H3: customer satisfaction has a significant impact on customer profitability.

2.7. Customer profitability and customer retention

In its paper of marketing profitability, Lenskold Group (2003) characterize customer retention as a continuous flow of customer profitability. For an organization to maintain its profitability stream, it is called upon the development of strategies that better customer retention. Dubihlela and Molise-Khosa (2014) use a sample of managers of hotels to test the relationship between e-CRM, customer loyalty, customer retention, and customer profitability. Their results accept the hypothesis that customer profitability is significantly associated to customer retention. Hence, the following hypothesis is suggested:

H4: customer profitability has a significant impact on customer retention.

2.8. Customer satisfaction and customer retention

While customer satisfaction is measured in terms of the fulfillment of the gap between customer expectation and customer actual experience, customer retention refers to the continuity of relationships between the organization and the customer (Ibojo & Asabi, 2015). Bowen and Chen (2001) underline the importance of customer satisfaction in order to ensure customer retention. Subsequently, the following hypothesis is presumed:

H5: customer satisfaction has a significant influence on customer retention.

3. METHODOLOGY OF THE STUDY

3.1. Study sample, data collection, measurements and statistical techniques

This study uses a sample consisted of 750 managers and employees working at different types of restaurants in the capital city of Saudi Arabia, Riyadh. The data of the study is collected by a questionnaire developed based on previous studies and structured using a five-point Likert scale. CRM assessed using 12 items (Chen & Popovich, 2003; Kincaid, 2003 cited in Piroozfar & Yaghini, 2012; ElKordy, 2014; Boudiaf, 2016; Minna & Aino, 2005; Khodakarami & Chan, 2014), customer satisfaction measured by 4 items (Singh & Singh, 2016), customer loyalty evaluated by 6 items (Kangu et al., 2017), customer profitability measured using 4 items (Pezeshki et al., 2005), and finally, customer retention estimated by 4 items (Wachira & Were, 2016). Accordingly, the questionnaire of the study consists of 30 items. The questionnaire distributed by hand to respondents and 497 questionnaires are returned complete and usable for the purpose of statistical analysis. The Analysis of Moment Structures (AMOS, V.22) is used to analyze the collected data.

3.2. Reliability and validity of the questionnaire

Reliability is measured using the average variance extracted coefficients and validity is measured by discriminant validity. The results in Table 2 show that the criteria in request for reliability and validity tests are met. The values of composite reliability ranged from 0.924 to 0.940 with values of AVE from 0.694 to 0.822 as well as the

square root of AVE values, shown in bold and the correlation coefficients between variables below these values, indicate an acceptable level of reliability and validity.

indices of model fitness. Based on these results, there is an acceptable fit between the hypothetical model and the sample data.

4.2. Estimates

4. DATA ANALYSIS

4.1. Model fit summary

The results of the structural modeling equation related to the fitness of the model shown in Table 3 underline an acceptable

The findings of regression weights for the default model bring to light, as can be seen in Table 4 and Figure 1, a significant influence of customer relationship management (CRM) on customer satisfaction (CS) (estimate=1.264, S.E.=0.115, C.R.=10.979, $P < 0.05$), a significant influence of customer

Table 2. Reliability and validity results

Variable	COR	AVE	CRM	CS	CL	P	CR
CRM	0.939	0.771	0.878				
CS	0.933	0.742	0.442	0.861			
CL	.924	0.694	0.137	0.201	0.833		
P	0.940	0.801	0.288	0.268	0.103	0.894	
CR	0.928	0.822	0.093	0.025	0.132	0.322	0.906

Reliability measurements: COR (composite reliability) and AVE (average variance extracted), validity measurements: the square root of AVE and correlation coefficients.

Table 3. Model fit summary

Indices	Criterion	Value	Result
CMIN/DF	Less than 2-5	1.752	Accepted
GFI	More than 0.90	0.974	Accepted

satisfaction (CS) on customer loyalty (CL) (estimate=0.626, S.E.=0.137, C.R.=4.580, $P < 0.05$), a significant influence of customer loyalty (CL) on profitability (P) (estimate=1.508, S.E.=0.010, C.R.=14.884, $P < 0.05$), and a significant influence of profitability (P) on customer retention (CR) (estimate=1.134, S.E.=0.032, C.R.=7.603, $P < 0.05$). On the part of CS and CR, the results found a non-significant between these variables (estimate=-0.029, S.E.=0.014, C.R.=2.046, $P = 0.410$).

5. DISCUSSION

The aims of this study are fourfold. First, to investigate the influence of customer relationship management on customer satisfaction. Second, to explore the mediating role of customer loyalty in the

relationship between customer satisfaction and customer profitability. Finally, to assess the mediating role of customer profitability in the relationship between customer satisfaction and customer retention. Using a sample consists of 500 managers and employees working at different types of restaurants in the capital city of Saudi Arabia, Riyadh. The results point out that customer relationship management is significantly related to customer satisfaction. That is, hypothesis 1 is accepted.

The current data doesn't support the second hypothesis which assumes that customer loyalty mediates the relationship between customer satisfaction and profitability since there is a significant relationship between customer satisfaction and customer loyalty, a significant relationship between customer loyalty and profitability, and a significant relationship

¹ e: Error

between customer satisfaction and profitability. That is to say, customer satisfaction is significantly related to customer profitability, either directly or indirectly. The mediating role of customer profitability in the relationship between customer satisfaction and customer retention as suggested in hypothesis fails to be accepted, since there is a significant relationship between customer satisfaction and profitability, a significant relationship between profitability and customer retention, while there is no relationship between customer satisfaction and customer retention. Table 5. Explained the summary of hypotheses testing results

The results of the current study show a direct relationship between customer relationship management and customer satisfaction, a direct relationship customer satisfaction and customer profitability, and indirect relationship between customer satisfaction and customer retention. On the strength of these results, one can conclude that organizations pay more attention to customer relationship management in order to ensure their customers satisfied. From managers and employees of organizations under study, organizations direct their efforts to satisfy loyal and profitable customers. The results found a positive linkage between customer satisfaction and both customer loyalty and customer profitability.

However, organizations do not consider customer retention seriously in the absence of their profitability. In other words, organizations take three main considerations into their account to guarantee their customer retention: customer satisfaction, customer loyalty and customer profitability. Singh and Singh (2016) reported that the cost of satisfying one customer is less seven times than the cost required to attract a new

customer. Additionally, low percent of loyal customers, i.e., 20 percent contributes a high percent, e.g., 80 percent of organization's revenue.

In his work on the relationship between customer relationship management and marketing performance, Soliman (2011) indicates that most of the CRM concepts, i.e., process, strategy, philosophy, technology, and ability are ground on the establishment of profitable long-term relationships with customers on the basis of its ability to adopt in a continuous manner to every customer in order to retain him or her. In relation to customer loyalty, Minna and Aino (2005) identified creating customer loyalty as a major process of CRM. In the same context, Soliman (2011) defined CRM as an approach used to understand customers behaviors in order to increase their loyalty. Kangu et al. (2017) detects a positive influence of CRM as measured by technology infrastructure on customer loyalty. Minna and Aino (2005) mention a main theme of CRM philosophy which is to build and maintain long-term relationships with profitable customers.

All in all, Jha (2008 cited in Wachira and Were, 2016) think of customer retention as an ultimate outcome of CRM. Babatunde and Ajayi (2010) find out that CRM is positively affects customer profitability. Noor (2012) views customer satisfaction and loyalty as intangible components of e-CRM performance, and regard customer retention as a tangible aspect of e-CRM performance. Richards and Jones (2009) list several benefits of CRM based on the results of previous studies; enhanced customer satisfaction. In relation to the direct impact of CRM on customer satisfaction, Singh and Singh (2016) name enhanced customer satisfaction as a main advantage of CRM.

Table 5. Summary of hypotheses testing results

	Hypothesis	Result
H1	Customer relationship management is significantly related to customer satisfaction	Supported
H2	Customer loyalty mediates the relationship between customer satisfaction and customer profitability	Rejected
H3	Customer profitability mediates the relationship between customer satisfaction and customer retention	Supported

Richards and Jones (2009) state that the enhanced customer satisfaction is one of the most common benefits of CRM. Khedkar (2015) found appositive and significant effect of CRM on customer satisfaction which in turn affects customer loyalty. Despite the significant and direct impact of customer satisfaction on customer loyalty as this study find.

6. CONCLUSIONS

6.1. Recommendations

CRM results in satisfied customers, which in turn indirectly affects customer retention. The direct relationship is between customer satisfaction and customer loyalty and customer profitability. Therefore, organizations are required to undertake practices directed to attract profitable customers and take into their consideration how to retain those customers. Examples of methods employed this goal is to create loyalty programs, training programs designed to equip the organizational staff with knowledge and skills related to create long-term profitable relationships with customers.

Babatunde and Ajayi (2010), in their study on CRM in banking sector recommend banks to invest more in employee training in order to ensure an effective and efficient use of CRM. In agreement with Kangu et al. (2017), the presents study hold the view that organizations ought to adapt to technology advancements in order to increase their customers loyalty.

6.2. Limitations and future research

Despite the importance of the results found by the current study, it still limited to the sample of the study which consists of managers and employees of restaurants only. Researchers are called to use the same constructs in different organizations from different sizes. Another limitation of the study relates to the model of the study, where the direct or indirect relationships between customer relationship management on one side and customer loyalty, customer profitability, and customer retention on the other side. It is recommended to explore the relationship between these variables in the future. For example, further studies are needed to investigate the relationship between CRM and customer loyalty, either directly or indirectly through customer satisfaction. The generalization of the results should be carefully applied, since the study is kept within bounds of restaurants in the capital city, Riyadh. Moreover, the study measured customer satisfaction from managers' and employees' viewpoints. Future study should measure customer satisfaction from customers' perspectives. Based on Garrido-Moreno et al.'s (2014) results, two variables are necessary to ensure the success of CRM, which are organizational commitment and knowledge management. Figure 2 shows a suggested model that researchers should consider in their future studies.

Figure 2. Suggested model for future research

СТУБОВИ ЗАДРЖАВАЊА ПОТРОШАЧА: ЕМПИРИЈСКА СТУДИЈА О УТИЦАЈУ ЗАДОВОЉСТВА, ЛОЈАЛНОСТИ И ПРОФИТАБИЛНОСТИ ПОТРОШАЧА НА ЊИХОВО ЗАДРЖАВАЊЕ

Bader Almohaimmeed

Извод

Циљ ове студије је истражити односе између пет фактора: управљање односима са потрошачима, задовољство потрошача, лојалност потрошача, профитабилност и задржавање потрошача. Узорак студије чини 750 менаџера и запослених у различитим ресторанима у Ријаду, главном граду Саудијске Арабије. Упитник састављен за потребе ове студије ручно се делио испитаницима. Од 750 подељених упитника, 497 је враћено се исправним одговорима, што чини високу стопу добијених одговора. Анализа тренутних структура (АМОС, верзија 22) коришћена је за анализу прикупљених података. Резултати ове студије открили значај утицаја управљања односима са потрошачима на задовољство потрошача, као и значајан утицај задовољства потрошача на лојалност и на профитабилност потрошача. Стога, подаци не подржавају хипотезу да лојалност потрошача посредује у односу између задовољства и профитабилности потрошача. Са друге стране, постоје значајни односи између задовољства и профитабилности потрошача и између профитабилности и задржавања потрошача, док не постоји значајна веза између задовољства и задржавања потрошача.

Кључне речи: управљање односима са потрошачима, задовољство потрошача, лојалност потрошача, профитабилност потрошача, задржавање потрошача.
