## AQUATIC AND SEMIAQUATIC HETEROPTERA OF SERBIA

LJILJANA PROTIC<sup>1\*</sup>, BOJANA NADAŽDIN<sup>2</sup>

<sup>1</sup> Natural History Museum in Belgrade, 11000 Belgrade, Njegoševa 51, Serbia,  
e-mail: ljilja.protic@gmail.com

<sup>2</sup> HabiProt, Janka Čmelika 28a 3/25, 21000 Novi Sad, Serbia

This paper includes a list of 62 species of Heteroptera (Nepomorpha and Gerromorpha), categorized into 12 families: Nepidae (2), Belostomatidae (1), Corixidae (25), Naucoridae (1), Aphelocheiridae (1), Notonectidae (6), Pleidae (1), Mesoveliidae (1), Hebridae (3), Hydrometridae (2), Velidae (9) and Gerridae (10). Two species are new for the fauna of Serbia: *Hesperocorixa moesta* (Fieber, 1848) and *Velia (Plesiovelia) mancinii mancinii* Tamanini, 1947.

**Key words:** Heteroptera, Nepomorpha, Gerromorpha, checklist, Serbia

## INTRODUCTION

Heteroptera of *aquatic and semiaquatic* habitats classified into two infraorders, Nepomorpha (aquatic bugs) and Gerromorpha (semiaquatic bugs). The highest diversity of aquatic and semiaquatic bugs is in tropical areas. There are about 4800 species described on the global scale and over 600 species in the Palearctic (Reduciendo Klementova *et al.* 2015). They

inhabit a wide range of habitats, from marine and shallow waters to arctic and high alpine. They are recorded on the water surface, on riverbanks in moss, aquatic and coastal vegetation. They are present in almost every freshwater biotope. Generally, they are predatory, while a smaller number of species is omnivorous.

Studies on aquatic and semiaquatic true bugs in Serbia has been neglected in comparison to terrestrial species. Individual records of aquatic and semiaquatic bugs are included in many faunistic papers (Divac 1907, Kormilev 1936, 1938, 1939, 1939a, 1943, Protić 1985, 1990, 1992, 1998, 2011a, 2011b, 2019, Protić *et al.* 2017, 2017a, Protić & Živić 2007, Protić & Živić 2012, 2013, Šeat 2011, 2013, 2017, Šeat & Nadaždin 2015, 2018, Šeat *et al.* 2016, Živić *et al.* 2007, Živojinović 1950).

The first check-list of Heteroptera of Serbia (Protić 1993/1994) and the Catalogue of the Heteroptera fauna of Yugoslav countries (Protić 1998) included lists of aquatic and semiaquatic true bugs in Serbia. After these publications, numerous new data were collected new species were recorded for Serbia, while other species were recorded in new localities.

The aim of this paper is to publish for the first time all-including data overview on species from infraorders Nepomorpha and Gerromorpha, stored at the Entomological Collection of the Natural History Museum in Belgrade (NHMBEO) and Alciphron database, along with an overview of references for previously published records. Most of specimens were collected by aquatic sampling net (benthic sampling or sweeping of aquatic plants) and some specimens were sampled in light trap.

In the Entomological Collection of the Natural History Museum in Belgrade, aquatic and semiaquatic true bugs are categorized by families and genera, but until recently there were some unidentified stored specimens. In the last few years, specimens from the collection were determined with help of our colleagues Ping-Ping Chen and Nico Nieser (Naturalis Biodiversity Centre, Leiden, The Netherlands) and Gavril Marius Berchi (West University of Timișoara, Romania).

The online database “Alciphron” a database for collecting data on insects in Serbia, was established in 2012 and it is available on the Internet since 2014 (HabiProt 2014–2019). The administrators for Heteroptera are Jelena Šeat and Bojana Nadaždin. There are numerous participants in the database, and they entering field data on a daily basis (locations where specimens were found and date and photograph of each specimen), while administrators identify or verify each recording. At the time of writing this paper, the database includes 233 records of aquatic and semiaquatic true bugs identified to species level. Most of the recorded specimens are stored in private collections of the second author and Jelena Šeat, while a few are

stored at the Faculty of Science at the University of Kragujevac. Certain specimens were identified only from photographs (such records are marked with "F" in the species list).

During the processing of the material and preparation for writing this paper, it was very useful to compare the papers on aquatic and semiaquatic bugs from neighboring and other European countries. All of these data are important for understanding biology and ranges of certain species: Andersen 1982, Benedek 1970, Berchi 2013, Berchi & Kment 2015, Berchi *et al.* 2016, Boda *et al.* 2015, Cianferoni 2013, 2019, Cianferoni & Nardi 2013, Csabai *et al.* 2017, Damgaard 2006, Fent *et al.* 2011, Gogala 2003, Jansson 1986, Josifov 1986, 1999, Josifov & Simov 2006, Kanyukova 2006, Kment & Beran 2011, Rabitsch & Zettel 2000, Schuster 1983, Soós *et al.* 2009, 2010, Tamanini 1959, Wróblewski 1980, Zimmermann 1982, Zimmermann & Scholl 1993.

The order of families and species follows the *Catalogue of the Heteroptera of the Palearctic Region* (Aukema & Rieger 1995; Aukema *et al.* 2013). Specimens were determined by using identification keys and individual taxonomic papers (Andersen 1996, Dahl 2005, Jaczewski 1962, Jaczewski & Wróblewski 1976, 1978, Jansson 1986, 1996, Poisson 1957, Savage 1989, 1990, Stichel 1955–1956, Wachmann *et al.* 2006).

## RESULTS

### List of aquatic and semiaquatic true bugs in Serbia

#### NEPOMORPHA

##### **Nepidae** Laterille, 1802

###### 1. *Nepa cinerea* Linnaeus, 1758

### DISCUSSION AND CONCLUSIONS

Studies of aquatic and semiaquatic true bugs in Serbia started in the mid-19<sup>th</sup> century. The first data were included in papers by foreign entomologists (Fieber 1861, Horvath 1897), and later also in papers by own local experts (Divac 1907, Kormilev 1936, 1938, 1939, 1939a, 1943).

In recent years, online databases and photo-based data collection applications have been increasingly developed. Such tools turned out to be a very good method for collecting the basic data on species distribution, but we need to be very careful about photo-based identification and it should not replace the classic methods of identification through identification keys. This paper also includes a list of localities where true bugs were photographed, as an integral part of Alciphron database.

Summary of all analyzed data shows a list of 62 species recorded in Serbia, with 12 families: Nepidae (2), Belostomatidae (1), Corixidae (25), Naucoridae (1), Aphelocheiridae (1), Notonectidae (6), Pleidae (1), Mesovelidae (1), Hebridae (3), Hydrometridae (2), Velidae (9) and Gerridae (10).

Two new species were recorded for the fauna of Serbia: *Hesperocorixa moesta* (Fieber, 1848) and *Velia (Plesiovelia) mancinii mancinii* Tamanini, 1947.

In the old material in the Entomological Collection of the Natural History Museum, specimens of *Velia* sp. were mostly labeled as *Velia (Velia) rivulorum* (Fabricius, 1775). The review including checking and re-determining each specimen has shown presence of three species where none was actually *V. rivulorum*, and these were: *Velia (Plesiovelia) affinis filippii* Tamanini, *Velia (Plesiovelia) mancinii mancinii* Tamanini and *Velia (Plesiovelia) sauli* Tamanini.

For *V. rivulorum*, which is listed in the list of species, we only had data from very old papers (Horváth 1897, Csiki 1940, Kormilev 1936). According to Berchi & Kment (2015), the record for *V. rivulorum* from Bazijaš (Horváth 1897) pertains to *V. mancinii mancinii*. At the time it was the first record for Serbia, but today Bazijaš is within the borders of Romania. Therefore the official first records for Serbia are from Prokuplje and Avala – the mountain near Belgrade.

The original range of *V. mancinii* is the Mediterranean and the southern part of European Russia (Tamanini 1951, Josifov 1986, Aukema & Rieger 1995, Kment & Beran 2011, Berchi & Kment 2015). Records from Balkan Peninsula are generally quite old: Albania (Josifov 1986, Aukema & Rieger 1995); Bulgaria - Kresna Gorge June 24<sup>th</sup> 1938 (Tamanini 1949, Josifov 1963, 1999, Kment & Kolínova 2013); Croatia (Dalmatia) - Strobeč near Split April 12<sup>th</sup> 1937 (Novak & Wagner 1951); Republic of North Macedonia – Treska river in the north part October 26<sup>th</sup> 1959 (Wagner 1962); Serbia – Prokuplje, Beograd: Avala (this paper).

*Hesperocorixa moesta* was recorded at the site Dejanova Reka (river) at Vlasina (Fig. 4). This species mainly occurs in aquatic habitats that are temporary. Dejanova Reka is a narrow river that forms a humid peat habitat, and the whole area actually represents the remains of a former large peat bog. *H. moesta* was also recorded in the neighboring countries: Croatia, Bosnia and Herzegovina, North Macedonia and Slovakia (Protić 1998, Reduciendo Klementova *et al.* 2015).

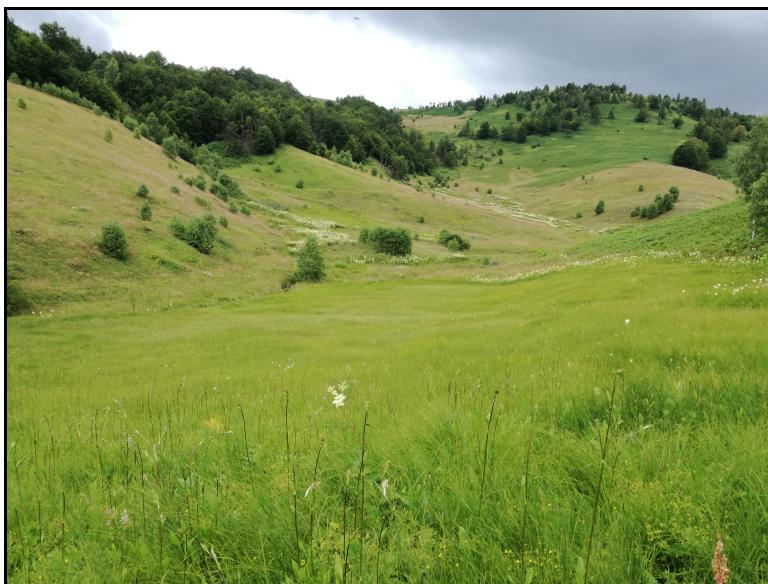

Fig. 4 – River Dejanova Reka (Vlasina) - *Hesperocorixa moesta* habitat (photo Bojana Nadaždin).

The list of species includes one Balkan endemite - *Velia serbica*, as well as two glacial relicts - *Hesperocorixa sahlbergi* and *Arctocorisa ger-mari* (Josifov & Simov 2006, Beron 2016, Gueorguiev *et al.* 1998).

*Lethocerus patruelis* has so far been found in Serbia at only one site – Obilić (Kormilev 1936). The record from Raška (locality Supnje) is only the second record after 79 years. This specimen is stored at the Entomological Collection of the Faculty of Science at the University of Kragujevac.

Some species were only mentioned in literature data, for example individual records of: *Micronecta (Dichaetonecta) pusilla* (Horváth) - Horváth 1897; *Micronecta (Dichaetonecta) scholtzi* (Fieber) - Divac 1907; *Sigara (Subsigara) distincta* (Fieber) - Kormilev 1936; *Microvelia (Microvelia) pygmaea* (Dufour) - Horváth 1903.

There are 13 new species for the Catalogue of the Heteroptera of the Palearctic Region: *Callicorixa praeusta praeusta* (Fieber), *Hesperocorixa moesta* (Fieber), *Hesperocorixa parallelia* (Fieber), *Sigara (Retrocorixa) semistriata* (Fieber), *Sigara (Subsigara) iactans* Jansson, *Anisops sardeus* Herrich-Schaeffer, *Notonecta maculata* Fabricius, *Notonecta viridis* Delcourt, *Hydrometra gracilenta* Horváth, *Microvelia (Microvelia) pygmaea* (Dufour), *Velia (Plesiovelia) mancinii* Tamanini, *Velia (Plesiovelia) sauli* Tamanini and *Velia (Plesiovelia) serbica* Tamanini.

Within the Table S1 occurred in Hungary, and the neighbouring countries Boda *et al.* (2015) listed three species for Serbia that are not included neither in our database nor in the Catalogue of the Heteroptera of the Palaearctic Region: *Arctocorisa carinata carinata* (C.R. Sahlberg), *Sigara dorsalis* (Leach) and *Mesovelia vittigera* Horváth.

We are witnessing the expansion of the range of individual Mediterranean species to a wider area of Europe, including Serbia (Rabitsch 2008, Protić 2011b, Šeat *et al.* 2019) and it is realistic to expect more of new species in national fauna in coming years. One good example is the expansion of *Anisops sardeus* Herrich-Schaeffer from the Mediterranean–Croatia, Island Šolta (Jaczewski 1934, Kment & Beran 2011) toward the Central Europe. This species was recorded in: Bulgaria (Josifov 1955, Stoianova & Simov 2014), southern Russia (Khatukhov *et al.* 2008), Hungary (Soos *et al.* 2010), Romania (Berchi 2011), northern Italy (Cianferoni & Pinna 2012, Cianferoni & Terzani 2013), Slovakia (Reduciendo & Svitok 2014) and Serbia (Šeat *et al.* 2019).

The existing data are the result of individual samples and only a small number of watercourses in Serbia have been systematically studied. However, by analyzing the localities of existing records we concluded that

most of Serbian territory has been covered and that diversity of aquatic habitats is high (Matvejev & Puncer 1989, Lakušić *et al.* 2005).

Fig. 5 – The Pčinja Valley (photo Bojana Nadaždin).

We believe that the number of 62 species is realistic for Serbia, considering the diversity of habitats from those at low altitudes (below 100 m) to those above 1000 m a.s.l. This number should increase in the near future, as several young entomologists have joined the studies of heteropterans in Serbia in the last few years. Studies on some insufficiently explored areas (Valley of Pčinja River (Fig. 5), Vlasina and Pešter highland Plateau) started in the last two years and visits to new sites are planned. Therefore we expect records of new species and to complement the distribution of aquatic and semiaquatic true bugs in Serbia.

## ВОДЕНЕ СТЕНИЦЕ У СРБИЈИ

ЉИЉАНА ПРОТИЋ И БОЈАНА НАДАЖДИН

РЕЗИМЕ

Истраживања стеница (Heteroptera) водених, влажних и мочварних станишта су годинама у Србији била запостављена у односу на терестрична станишта. Иако први подаци о воденим стеницама потичу из половине 19. века, систематских истраживања није било. Последњих година све је више истраживача у Србији који обраћају пажњу и на истраживање и сакупљање водених стеница (Nepomorpha и Gerromorpha).

Циљ рада је дати приказ врста водених стеница Србије на основу примерака из збирки Природњачког музеја у Београду, базе „Alciphron“ и литературе.

Састављен је списак који укључује 62 врсте. Пронађене су две нове врсте за фауну Србије: *Hesperocorixa moesta* (Fieber, 1848) и *Velia (Plesiovelia) mancinii mancinii* Tamanini, 1947. Од укупног броја наведених врста једна је балкански ендемит - *Velia serbica* Tamanini, 1951 а две су глацијални реликти - *Hesperocorixa sahlbergi* (Fieber, 1848) и *Arctocorixa germari* (Fieber, 1848).
